1. First, right-click on the Desktop or any location you prefer and choose **New -> Text document**.

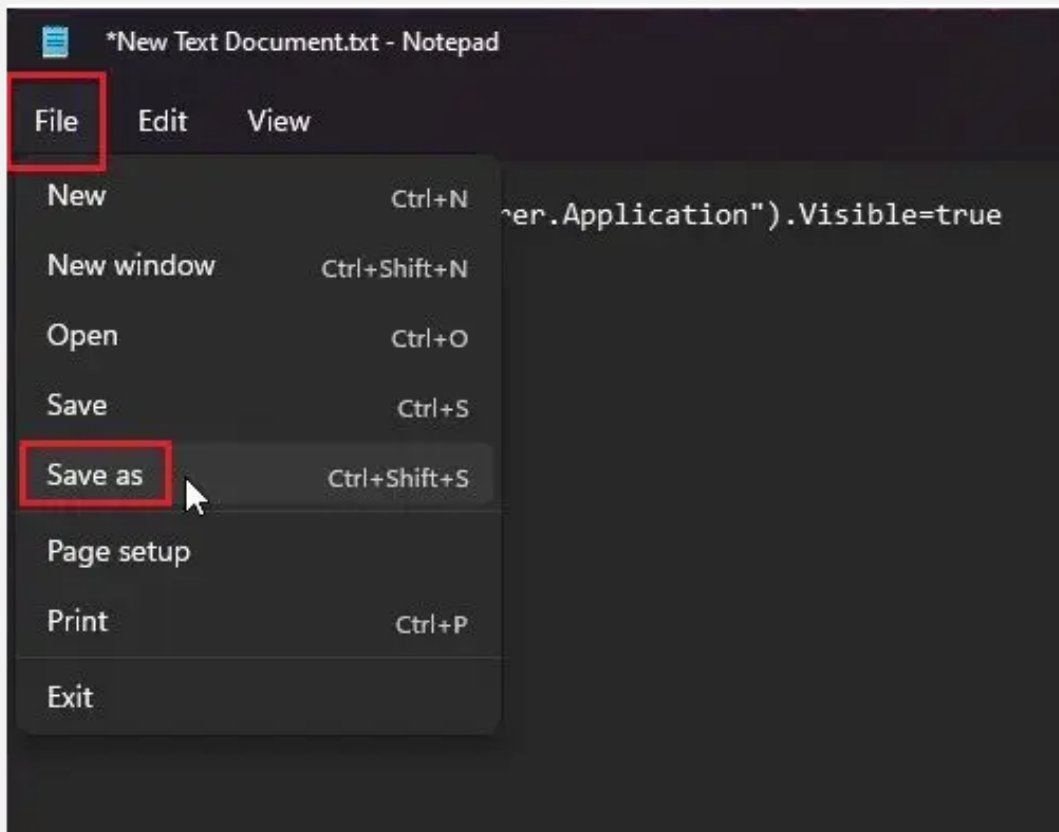

2. Once the text file opens up, **copy and paste** the below code into the Notepad file.

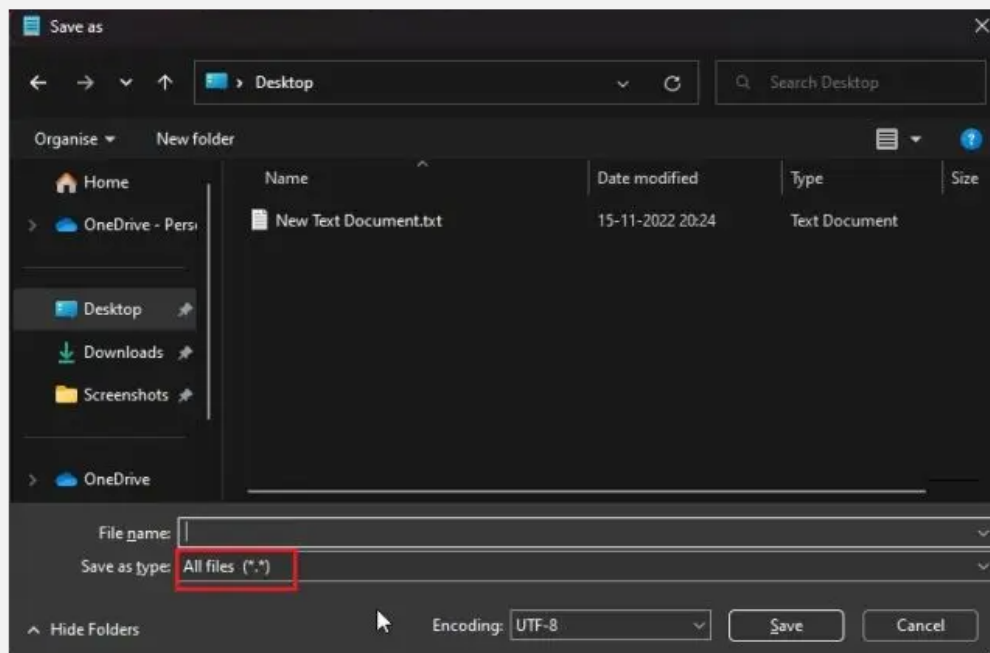

```
CreateObject("InternetExplorer.Application").Visible=true
```

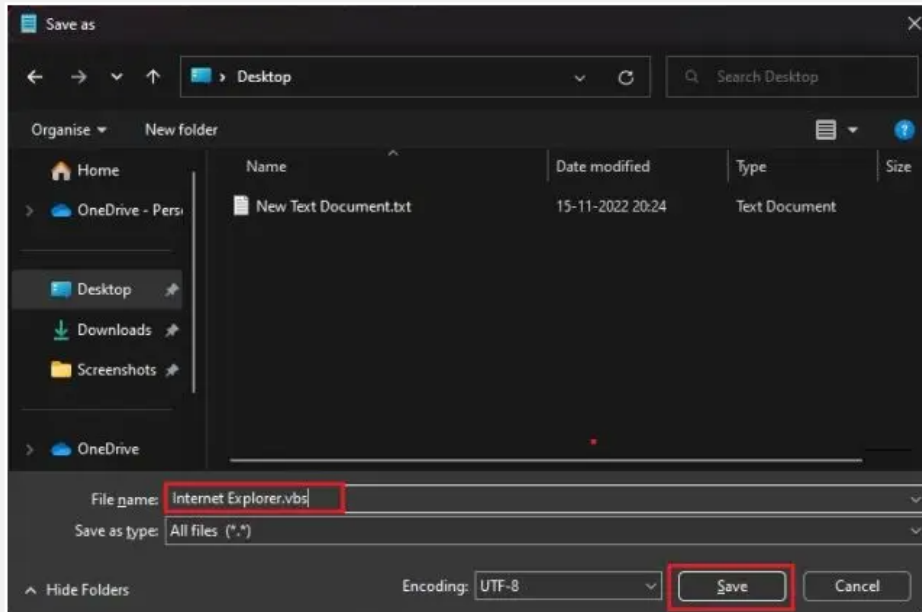

3. After that, click on **File -> Save as**.

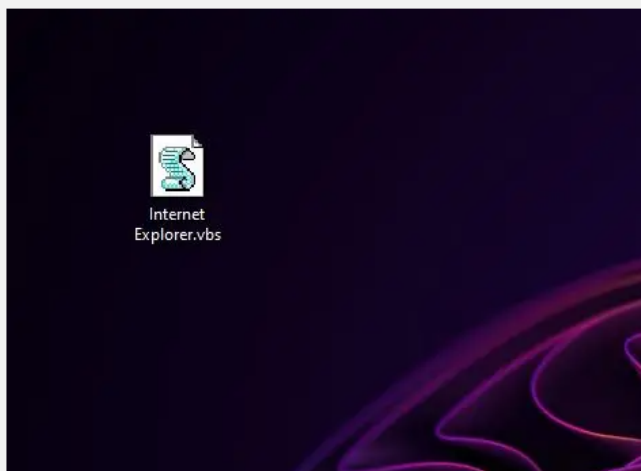

4. Here, click on the drop-down menu next to “Save as type” and change it to “**All files (*.*)**”.

5. After that, set a name for the shortcut with **.vbs extension** at the end. For example, I have named the file `Internet Explorer.vbs`. Now, save the file to a preferred location like your Desktop.

6. Now, **double-click on the VBS file**, and there you have it. Internet Explorer 11 will open up on your Windows 11 PC, and it works flawlessly without any issues. From now onwards, you only need to double-click on the VBS file to use IE 11.
